Rock wool

Item figure represents an approximate value of 40 euros.

Price estimation

Degree of difficulty

The icons represent the difficulty of implementation, with a figure being the number of icons used to grade the action.

Description: Rock or mineral wool can retain large amounts of water and air that aid root growth and nutrient absorption in hydroponics; Its fibrous nature also provides a good mechanical structure to keep the plant stable. The naturally elevated pH of mineral wools makes them initially unsuitable for plant growth and requires "conditioning".

Rockwool is usually used only in the seedling phase (clones, but can remain with the base of the plant through
