Bucket and Candle Filter

Where it has been implemented:
Different Countries

Proponent:
KATADYN ROPYDIN

Item figure represents an approximate value of 40 euros.

Price estimation

Degree of difficulty

The icons represent the difficulty of implementation, with a figure being the number of people required to implement the system.

Description: Similar to traditional filters such as the eco filter, but in this case the filtration is done by a "candle" that is horizontal. It is supplied without the water containers, which must be purchased locally. It can be purchased as a siphon kit, with a tube connected to the filter that channels the water to a drinking water container. Very easy to use. Maintenance is performed by clear periodically, this being the safety mechanism.

Interesting features: It is easy to transport and its maintenance
